### **Executive summary**

Behavioral health conditions, such as mental health and substance use disorders, affect millions of Americans and contribute to significant morbidity, mortality, and economic burden. However, access to behavioral healthcare across the United States is not uniform, and many individuals face challenges in obtaining timely, appropriate, and affordable services and treatment. Understanding the current state of behavioral healthcare access across the United States is crucial for developing and implementing effective policies and interventions to improve the quality and outcomes of behavioral healthcare for all.

Milliman was commissioned by Inseparable, Inc. to produce a report on measures related to access to behavioral healthcare services across the United States. Access to care is a broad concept that can mean many different things to different people. In the most general sense, access to care may refer to the ability of individuals to obtain care when needed or desired—whether or not they actually do so. Access in the abstract is challenging to measure directly, though there are many factors related to access worth consideration for which data are available.

Some have framed access as deriving from the interplay of healthcare needs, supply, and demand.<sup>2</sup> For the purposes of this paper, we provide statistics related to 1) the prevalence of behavioral health conditions (indicators of needs), 2) usage of behavioral health services (indicators of the portion of demand that is actually met), and 3) the availability and affordability of behavioral health providers (indicators of supply). We provide these metrics separately by state and by healthcare coverage type where sufficiently detailed data are available. This information is derived from a combination of publicly available survey data and public health surveillance tools as well as proprietary and licensed claims datasets. While these metrics may not give a full picture of access to care, our intent is to provide a broad look at some of the factors that contribute, as well as how individuals are currently using available behavioral healthcare resources.

Key findings are described below, and further details are described throughout this report. We have also provided a glossary with definitions of key terms, as well as appendices with summaries of all metrics by state for ease of reference.

#### **KEY FINDINGS**

By many measures, access to behavioral healthcare services is highly variable across the United States, and even
among healthcare coverage types within each state. As a result, the accessibility of care can vary widely for
individuals living in different areas of the country, that have different healthcare coverage types, that have different
needs, or that have different levels of personal resources.

#### Measures of the prevalence of behavioral health conditions

2. Over 24% of individuals across three major healthcare coverage types (commercial, Medicare Fee-for-Service [FFS], and Medicaid) had diagnoses for at least one behavioral health condition in 2021. The prevalence of diagnosed behavioral health conditions was highest in Rhode Island (32%) and lowest in Texas (15%).

#### Measures of behavioral health treatment patterns

- 3. Only 33% of individuals diagnosed with a behavioral health condition received treatment from a behavioral health specialist within the year in 2021. Those with Medicaid coverage had the highest rates of behavioral health specialist care (44%) and those with Medicare FFS coverage had the lowest (15.7%). While some individuals receive appropriate treatment through primary care or other types of providers, this high percentage of individuals diagnosed with behavioral health conditions not receiving treatment from a behavioral health specialist indicates a significant gap in care.
- 4. Across the studied healthcare coverage types, approximately 8% of emergency department (ED) visits nationwide included a principal diagnosis of a behavioral health condition in 2021. Medicaid had the highest rate of ED visits with a behavioral health diagnosis (12.9%) compared with Medicare FFS (7.3%) and commercial (6.9%). ED visits are often used as a measure of behavioral healthcare access and quality and can indicate under-managed care.
- Among those receiving outpatient behavioral health therapy, the average number of therapy visits was 10.8 per year in 2021. Variation between healthcare coverage types was less pronounced for this measure than for many others included in this report.

#### Measures of the availability and affordability of behavioral health providers

- 6. Mental health provider shortages are present in every state. In 2023, over half (52.7%) of the U.S. population lives in counties that are entirely designated as Mental Health Professional Shortage Areas (HPSA) and only 27.7% of the psychiatrists needed to remove these shortages are available across the United States. Psychiatrist need is not fully met in any of the 50 states.
- 7. While supply is not the only factor that influences the use of behavioral healthcare services, those living in areas of low behavioral health provider supply use much less behavioral healthcare services than those living in areas with the highest supply. For example, Florida has one of the lowest behavioral health provider supply ratios. Individuals with behavioral health conditions living in Florida only received 22.7% of the number of therapy visits that they would have received if they had received care at the same rates as those living in areas with the highest provider supply in 2021.
- Nationally, psychiatrists are less likely to accept healthcare coverage of all types compared to other specialties, further limiting access to the small number of providers available for those unable to pay out of pocket.
- The average self-pay cost for someone without insurance coverage for a 60-minute psychotherapy visit was \$174
  per visit in 2021. This cost represents a different level of barrier for different households depending on their income
  levels.
- 10. Among commercial health insurance plans that cover out-of-network services, 16.4% of costs for behavioral health services were for care provided out-of-network in 2021.

#### **CONCLUSIONS**

The research highlights the differences that exist in the prevalence of behavioral health conditions, the use of treatment, and the availability and affordability of behavioral health providers across the United States. While access is a complex topic and involves additional considerations beyond those included in this report, many metrics for which data are available point to aspects of access that could potentially be improved. The findings underscore the urgent need for strategies to increase the availability and affordability of behavioral health services, particularly in states with high prevalence rates and low provider availability.

The findings also highlight the financial barriers to accessing behavioral health services, particularly for individuals without healthcare coverage. Strategies to increase healthcare coverage and reduce out-of-pocket costs could help to improve access to behavioral health services.

It is critical to consider location and population factors when interpreting state-based results and considering implications for state or federal policy, insurance policies, practice guidelines, or other types of interventions. Results from this study can help shed light on specific areas of strengths or challenges across states.

### Introduction

As the prevalence of behavioral health conditions (mental health and substance use disorders) in the United States has increased in recent decades, access to behavioral health services has been a critical challenge. Between 2001 and 2021, suicide death rates increased by 32% (14.1 deaths per 100,000 population in 2021 vs. 10.7 in 2001) and drug overdose death rates have increased by 376% (32.4 deaths per 100,000 in 2021 vs. 6.8 in 2001).<sup>3,4</sup> According to the National Institute for Mental Health, less than half (47.2%) of the approximately 57.8 million American adults living with any mental illness received any mental health services in 2021.<sup>5</sup> About half of Americans live in designated Mental Health Care Health Professional Shortage Areas (HPSA) and over 8,300 additional providers would be needed to remove these HPSA designations.<sup>6</sup>

According to an October 2022 survey conducted by CNN and the Kaiser Family Foundation, a significant majority of the American public (9 of 10 adults) believe there is a mental health crisis in the United States. Availability of mental healthcare providers, especially those who take insurance and who are culturally representative of the populations that they treat, were highlighted as contributors to the concerns around behavioral healthcare. While the COVID-19 pandemic magnified these issues, access challenges for behavioral healthcare in the United States are not new. In 1999, the Surgeon General published a report on mental health that highlighted the prevalence of mental health disorders, the impact on society, and the importance of improving access to mental health services.

Although geographic variation in the cost and utilization of healthcare services in general is well described in the literature, less has been written about geographic variation in behavioral healthcare services specifically. <sup>10,11,12,13</sup> Of studies that have been published, many are limited to a single market or national survey data, and they often focus on single measures in isolation, such as provider supply or emergency department utilization. <sup>14,15,16,17,18</sup> In this report, we have assembled a range of measures related to behavioral healthcare access for all 50 states and (when available) Washington, D.C., including details (where applicable) by healthcare coverage type. The aim of this study is to illustrate the variation in behavioral health access measures across states. Understanding variations in these measures is crucial for informed policy decisions, targeted interventions, and ultimately, for enhancing the accessibility and effectiveness of behavioral healthcare across the nation.

It's important to acknowledge that access is a broad, complex concept, involving many factors that may or may not be readily measurable. In a general sense, access may be viewed as the ability of individuals to use behavioral healthcare services when they need or want to. Factors such as the supply of behavioral health clinicians, reimbursement structures, provider networks, socioeconomic conditions, cultural attitudes, individual and provider preferences, insurance, and benefit administration policies, as well as local-, state-, and federal-level policies can influence the extent to which individuals are able to or choose to use behavioral health services.

Some have described access as deriving from the interplay between needs, demand, and supply of healthcare services. <sup>19</sup> For this study we relied on a combination of publicly available health-related data sources and large commercial, Medicare, and Medicaid claims databases to quantify access to behavioral healthcare across states and markets using three categories of measures aligning with this framework:

- A. Measures of the prevalence of behavioral health conditions (as indicators of needs).
- B. Measures of behavioral health treatment patterns (as indicators of the portion of demand that is met).
- C. Measures of the availability and affordability of behavioral health providers (as indicators of supply).

The body of this report describes national results and the range of variation across states. Additional details, including state-by-state and regional summaries across all studied metrics, are available in the appendices. When comparing results across states in the context of relative performance and potential to achieve solutions through policy changes, rulemaking, or other interventions, the reader should be mindful of any important differences in population demographics, population density, income distribution, rural/urban split, existing policies or programs, and other factors that influence the demand for and access to behavioral healthcare services.

Note that the measures included throughout this study reflect those for which appropriate data were available. Many factors influence the demand for behavioral health services and the ability of individuals to access services when

needed, and not all factors could be included in this analysis. Some additional factors that we were not able to directly measure but that should also be considered include (for example):

- Accuracy of provider directories used by consumers or providers to find providers.
- Ease of identifying and scheduling available providers, including wait times for an appointment.
- Ease of physical access to available providers, considering available modes of transportation and time or distance
  of travel.
- Availability of childcare and/or leave from employment to accommodate appointment times.
- The cultural competence or language concordance of available providers.
- Availability of providers adequately trained to address the unique needs of specific populations, such as traumainformed care, gender identity and sexual orientation-related challenges, racism or discrimination related to minoritized status, etc.
- Personal preferences, social stigmas, cultural attitudes, or other factors related to perceptions and attitudes towards behavioral health conditions, providers, or services.

Care should be taken when interpreting the results in this report. We have provided each of the measures to enhance understanding around factors that influence access to care and how these factors vary across geographic regions. Populations that have access to care through commercial insurance coverage, Medicare, and Medicaid have differing demographics and characteristics and the results for these coverage types should be considered with those differences in mind.

Key data sources used for this study include publicly available data sources such as the Behavioral Risk Factor Surveillance System (BRFSS), National Center for Health Statistics (NCHS) – Mortality Files, U.S. Census Bureau, and others. We also leveraged a number of administrative healthcare claims datasets, including Milliman's proprietary Consolidated Health Cost Guidelines Sources Database for those covered by commercial insurance or Medicare Advantage, the CMS Transformed Medicaid Statistical Information System (T-MSIS) for those covered by Medicaid or the Children's Health Insurance Program (CHIP), and the CMS Medicare 100% Research Identifiable Files (RIF) for those covered by Medicare. Collectively, we included the healthcare claims experience of nearly 125 million individuals across these datasets. All data sources are further described in the Methodology section of this report.

## **Detailed findings**

#### A. MEASURES OF THE PREVALENCE OF BEHAVIORAL HEALTH CONDITIONS

Access to behavioral health services is, in part, a function of the underlying need for behavioral health services. To contextualize the need for mental health and substance use disorder (SUD) services in each state, we first provide a range of statistics related to the prevalence of behavioral health conditions by state. There may be many ways to conceptualize or measure the prevalence of behavioral health conditions, but for the purposes of this report we have focused on the following measures:

- Diagnosed prevalence of any behavioral health condition, and of suicidal ideation or intentional harm, as identifiable in administrative healthcare claims data.
- Self-reported measures of mental health:
  - Percent of adults that experience frequent mental distress, as well as average number of poor mental health days per month, as self-reported in survey data.
  - Suicide and drug overdose death rates, as reported in national vital statistics.

We selected these measures to reflect how behavioral health conditions manifest in healthcare settings (based on diagnoses present in claims data, how individuals subjectively rate their own mental health (as self-reported in survey data)), and the most adverse outcomes of behavioral health conditions (mortality).

#### Diagnosed prevalence of behavioral health conditions

Across three major healthcare coverage types in the United States combined (commercial, Medicare FFS, and Medicaid), we found that over 24% of individuals had diagnoses for at least one behavioral health condition in 2021 (see the Methodology section for specific identification criteria used). These include diagnoses by any medical provider, including behavioral health specialists, primary care providers, and others. Over 9% of individuals had diagnoses for multiple behavioral health conditions. Among all states, prevalence of diagnosed behavioral health conditions among those with healthcare coverage was highest in Rhode Island, where nearly a third of the population (32%) was diagnosed with a behavioral health condition, and lowest in Texas, at 15%. Note that because these measures are based on diagnoses present in claims data, only those with healthcare coverage are included. Prevalence rates may differ among those without healthcare coverage.

Figure 1 illustrates the prevalence of individuals diagnosed with at least one behavioral health condition by state and market. We have sorted the chart based on the blended prevalence rate across the included healthcare coverage types for each state.

FIGURE 1 – PREVALENCE OF DIAGNOSES FOR ANY BEHAVIORAL HEALTH CONDITION BY STATE AND HEALTHCARE COVERAGE TYPE, 2021

As illustrated by both Figures 1 and 2, Medicare FFS beneficiaries on average had much higher prevalence rates than individuals with commercial or Medicaid healthcare coverage. In general, behavioral health conditions are less common for those with commercial insurance coverage than for those with Medicaid or Medicare FFS coverage.

The box and whisker plot in Figure 2 provides a visual representation of the variation between states in the prevalence of any behavioral health condition by healthcare coverage type. The height of the box represents the 25<sup>th</sup> and 75<sup>th</sup> percentiles, the horizontal line through the box represents the median prevalence rate, the vertical line represents 1.5 times the interquartile range (75<sup>th</sup> percentile minus the 25<sup>th</sup> percentile) and is used to identify outliers, which include any dots that fall outside the span of the vertical line. Each state is represented by a dot scattered around the plot. Appendix A provides further detail for each individual state.

FIGURE 2 – VARIATION BETWEEN STATES IN THE PREVALENCE OF ANY BEHAVIORAL HEALTH CONDITION, BY HEALTHCARE COVERAGE TYPE, 2021

#### Diagnosed prevalence of suicidal ideation and intentional self-harm

Across three major healthcare coverage types in the United States combined (commercial, Medicare FFS, and Medicaid), we found that 0.3% of individuals had a diagnosis for at least one form of suicidal ideation or intentional self-harm in 2021 (see the Methodology section for specific identification criteria used). Among all states, the prevalence of diagnosed suicidal ideation or intentional self-harm was highest in Ohio, where 0.4% had diagnoses related to suicidal ideation or intentional self-harm, and lowest in Hawaii, at 0.04%.

Figure 3 illustrates the prevalence of individuals with diagnoses for suicidal ideation or intentional self-harm by state and healthcare coverage type. Like Figure 1, the chart is sorted based on the blended prevalence rate across the included healthcare coverage types for each state. As before, we could not report Medicare Advantage rates at the state level within this figure, but instead report results by Census division in Appendix B.

FIGURE 3 – PREVALENCE OF DIAGNOSES FOR SUICIDAL IDEATION AND INTENTIONAL SELF-HARM BY STATE AND HEALTHCARE COVERAGE TYPE, 2021

#### Self-reported measures of mental health

While prevalence measures derived from healthcare claims data reflect diagnoses that were observed and recorded in healthcare settings, these measures do not necessarily reflect mental health symptoms that do not meet clinical diagnostic criteria, or that were not presented to providers. To provide a sense of how individuals subjectively describe their own mental health, we have included two self-reported metrics from the Behavioral Risk Factor Surveillance System (BRFSS, as summarized by County Health Rankings), including the percentage of adults with frequent mental distress (at least 14 days per month) and the average number of poor mental health days in the past month.<sup>20</sup>

About 14% of adults in the United States reported having frequent mental distress. South Dakota had the lowest percentage of adults experiencing frequent mental distress at 9.7%, and Arkansas had the highest at 18.7%. Furthermore, Americans reported an average of 4.4 days of poor mental health in the past month. Louisiana had the highest number of poor mental health days in the past month (5.7), and Illinois had the fewest (3.2).

Figures 4 and 5 provide a visual representation of variation in the rates of frequent mental distress and poor mental health days across the United States

FIGURE 4 - PERCENT OF ADULTS WITH FREQUENT MENTAL DISTRESS BY STATE, BRFSS 2020

FIGURE 5 – AVERAGE NUMBER OF POOR MENTAL HEALTH DAYS IN THE PAST MONTH BY STATE, BRFSS 2020

#### Suicide and drug overdose death rates

The complete impact of unmet behavioral health needs is difficult to measure. However, rates of the most adverse outcomes, such as suicide and drug overdose deaths, may provide some perspective. According to the National Center for Health Statistics – Mortality Files (NCHS, as compiled by County Health Rankings), the national average suicide death rate was 13.8 per 100,000 from 2016-2020, and the national average drug overdose death rate was 23.3 per 100,000 from 2018-2020. These rates vary widely between states, ranging from 6.2 to 27.4 suicide deaths per 100,000 for Washington D.C. and Wyoming, respectively, and from 8.5 to 56.8 drug overdose deaths per 100,000 for South Dakota and West Virginia, respectively. Figures 6 and 7 provide a visual representation of variation across the nation for each metric.

FIGURE 6 - SUICIDE DEATH RATES PER 100,000 POPULATION BY STATE, NCHS 2016-2020

FIGURE 7 – DRUG OVERDOSE DEATH RATES PER 100,000 POPULATION BY STATE, NCHS 2018-2020

#### **B. MEASURES OF BEHAVIORAL HEALTH TREATMENT PATTERNS**

Measures of the prevalence of behavioral health conditions provide context on the underlying demand for behavioral healthcare, but not how individuals are currently engaging with care. To this end, we selected the following measures to describe variation in behavioral health treatment patterns among states:

- Percent of individuals with a behavioral health diagnosis that received any specialty behavioral healthcare services.
- Average number of outpatient behavioral health therapy visits in a year for those receiving therapy.
- Percent of emergency department visits with a diagnosis for any behavioral health condition in the first or second position.
- Percent of emergency department visits or inpatient hospitalizations for any behavioral health condition with timely follow-up after discharge.

In the prior section, we describe the prevalence of diagnosed behavioral health conditions based on diagnoses present on claims data, but the presence of a diagnosis code does not necessarily reflect that an individual received any services specifically focused on their behavioral health condition. Further, many individuals may, out of necessity or preference, manage their behavioral health conditions exclusively through a primary care provider or other providers not specializing in behavioral health. Also, when individuals do receive care from a provider specializing in behavioral health, there can be significant variation in the amount or duration of specialty care received. Finally, individuals experiencing hospitalizations or emergency department visits for diagnoses related to behavioral health are often in a state of crisis, and effective follow-up care is critical to a successful discharge and recovery.

# Proportion of individuals with a behavioral health diagnosis that received any specialty behavioral healthcare services

Across three major healthcare coverage types in the United States, 33% of individuals who were diagnosed with a behavioral health condition received treatment from a behavioral health specialist within the same year (see the Methodology section for included treatment types). These rates are lowest in Texas where 22% of those with a behavioral health diagnosis received care from a behavioral health specialist. Note that some individuals may appropriately be treated for behavioral health conditions by primary care or other types of providers. We have not attempted to determine or measure adherence to the ideal treatment path for different individuals. Figure 8 below displays variation among states in the percentage of individuals with behavioral health diagnoses that received care from a behavioral health specialist by healthcare coverage type.

#### Average number of outpatient behavioral health therapy visits in a year for those receiving therapy

Across three major healthcare coverage types in the United States, we found that the population that received any outpatient behavioral health therapy averaged 10.8 therapy visits per year. The average number of therapy visits per year was lowest in Alabama with an average of 6.2 visits per year, and highest in Vermont at 15.5 visits per year. Interestingly, Alabama also has one of the lowest percentages of people with a behavioral health diagnosis receiving specialty treatment (23.6%), but Vermont did not have one of the highest rates and rather fell somewhere in the middle with 30.3% of individuals receiving specialty treatment. Variation between healthcare coverage types was less pronounced for this measure than for many others included in this report. Figure 9 shows the variation in this metric across the nation by healthcare coverage type.

FIGURE 9 – AVERAGE NUMBER OF OUTPATIENT THERAPY VISITS IN A YEAR FOR THOSE RECEIVING THERAPY, BY HEALTHCARE COVERAGE TYPE, 2021

# Percent of emergency department visits with a diagnosis for any behavioral health condition in the first or second position

Emergency department (ED) visits are often used as a measure of behavioral health access and quality. Ideally, behavioral health conditions could be managed to avoid emergencies that necessitate visits to emergency departments. However, individuals with under-managed conditions or that face barriers to outpatient care may ultimately end up in the ED for care. Rates of timely follow-up after emergency departments for behavioral health conditions are also included in some schemas that are commonly used to assess the health system performance related to quality of care. Across three major healthcare coverage types, we found that approximately 8% of emergency department visits nationwide were accompanied by a diagnosis for a behavioral health condition in the first or second position. This percentage ranged from approximately 5% (Texas) to 13% (Maine) across the nation. Figure 10 displays the detailed results by state and healthcare coverage type.

FIGURE 10 - PERCENTAGE OF EMERGENCY DEPARTMENT VISITS WITH A DIAGNOSIS FOR ANY BEHAVIORAL HEALTH CONDITION IN THE FIRST OR SECOND POSITION, BY HEALTHCARE COVERAGE TYPE, 2021

Note that ICD-10-CM coding guidelines specify criteria for identifying the principal or first-listed diagnosis—but sequencing of secondary diagnoses is not necessarily based on order of clinical significance.<sup>21</sup> In some cases, specific payers, performance measurement programs, risk adjustment methodologies, or other factors may introduce incentives that influence sequencing of secondary codes, and in other cases the sequencing is simply alphanumerical. As a result, the percentage of emergency department visits that involve a behavioral health diagnosis in any position is likely higher than reported here, and the percentage of such visits with a principal diagnosis for behavioral health is likely lower than reported here. These results are intended to inform discussions of geographic variation more so than absolute levels.

# Percent of emergency department visits or inpatient hospitalizations for any behavioral health condition with timely follow-up after discharge

When inpatient hospitalization or emergency department visits are needed, appropriate outpatient follow-up care is critical to successful discharge and recovery. Timely outpatient follow-up care after discharge is commonly used as an indicator of quality of care. Across three major healthcare coverage types, we found that 34% of inpatient or emergency visits had timely follow up care (within 30 days of discharge) across the United States. Timely follow-up rates vary significantly by healthcare coverage type and state. Figure 11 illustrates the variation in follow-up rates by healthcare coverage type. There is a much narrower range of rates between states for the Medicare FFS and commercially insured populations as compared with the Medicaid population. The Medicaid population in Vermont has the highest rate of timely follow-up rate (65%) while the Medicare FFS population in Oklahoma has the lowest (10%).

FIGURE 11 – PERCENT OF HOSPITALIZATIONS AND EMERGENCY DEPARTMENT VISITS FOR BEHAVIORAL HEALTH CONDITIONS WITH TIMELY FOLLOW-UP CARE, BY HEALTHCARE COVERAGE TYPE, 2021

#### C. MEASURES OF THE AVAILABILITY AND AFFORDABILITY OF BEHAVIORAL HEALTH PROVIDERS

The lack of available behavioral healthcare providers can be a major barrier to accessing behavioral healthcare across much of the United States. The behavioral healthcare provider shortage in the United States, is well-documented and by some measures behavioral health providers are reimbursed at lower rates for comparable services than their physical health counterparts, which can influence provider insurance acceptance rates and out-of-pocket costs for patients. <sup>22,23</sup> We used the following measures to understand these barriers across the country:

- Percent of population living within a designated Mental Health Provider Shortage Area.
- Percent of psychiatrist need met.
- Ratio of population to mental health providers.
- Therapy access benchmark ratio.
- Percentage of costs for behavioral healthcare that are for services provided out-of-network (for commercial plans with out of network benefits).
- Provider insurance acceptance rates.
- Patient out-of-pocket and self-pay costs for behavioral health services.
- U.S. population insurance coverage.
- U.S. population income levels.

These measures have been selected to provide insights on a variety of factors that influence the availability and affordability of behavioral healthcare in the United States. Where provider shortages exist in a geographic area, individuals may struggle to access care even if affordability is not a concern. For those without healthcare coverage or where many providers do not accept healthcare coverage, access may be a challenge even if the overall supply of providers is adequate.

#### Percent of population living in designated Mental Health Provider Shortage Areas (HPSA)

Mental Health Provider Shortage Areas (HPSA) are a designation used by the Health Resources and Services Administration (HRSA) to identify geographic areas, population groups, or facilities with a shortage of mental health providers. HRSA uses the ratio of mental health providers to population, the population's need for mental health services, and accessibility of services to determine HPSA designations.<sup>24</sup>

Based on HPSA designations and U.S. Census Bureau data, 174.7 million people (52.7% of the U.S. population) live in counties that are entirely designated as shortage areas, and only 23.7 million people (7.2%) live in counties that are not at all designated as shortage areas. The remaining 132.8 million people (40.1%) live in counties that are partly designated as shortage areas.

## FIGURE 12 - PERCENTAGE OF POPULATION LIVING IN MENTAL HEALTH PROFESSIONAL SHORTAGE AREAS, HRSA 2023

Below, we report the percentage of the population in each state that lives in counties that are entirely designated as Mental Health Professional Shortage Areas (Figure 13), that live in counties that are partly designated as Mental Health Professional Shortage Areas (Figure 14), or that live in counties that are not at all designated as Mental Health Professional Shortage Areas (Figure 15). For three states (including Idaho, Montana, and Utah) the entire population

(100%) resides in shortage areas. Vermont is the state least impacted by shortage areas, with over half of its population (51.1%) residing in counties that are not at all designated as shortage areas.

FIGURE 13 - PERCENTAGE OF POPULATION LIVING IN COUNTIES THAT ARE FULLY DESIGNATED AS MENTAL HEALTH PROFESSIONAL SHORTAGE AREAS, 2023

FIGURE 14 - PERCENTAGE OF POPULATION LIVING IN COUNTIES THAT ARE PARTLY DESIGNATED AS MENTAL HEALTH PROFESSIONAL SHORTAGE AREAS, 2023

None of county is shortage area

FIGURE 15 - PERCENTAGE OF POPULATION LIVING IN COUNTIES THAT ARE NOT DESIGNATED AS MENTAL **HEALTH PROFESSIONAL SHORTAGE AREAS, 2023** 

#### Percent of psychiatrist need met

Based on provider ratios used to determine HPSA designations, only 27.7% of psychiatrist need is met across the United States, and psychiatrist need is not fully met in any of the 50 states<sup>25</sup>. Arizona and Delaware have the lowest percentage of psychiatrist need met with 8.5% and 11.6% need met, respectively. New Jersey has the highest level of need met with 72.7% of need met, followed by Rhode Island with 61.9%. Figure 16 below shows the variation in this metric across the nation.

FIGURE 16 – PERCENT OF PSYCHIATRIST NEED MET BY STATE, 2023

#### Ratio of population to mental health providers

While the preceding metric focused specifically on psychiatrists (who have medication prescribing privileges) this metric includes a broader range of mental health providers, including psychiatrists, psychologists, licensed clinical social workers, counselors, marriage and family therapists, mental health providers that treat alcohol and other substance use, and advanced practice nurses specializing in mental healthcare.<sup>26</sup> When looking at the mental health provider workforce more broadly, nationally there are 338.2 people per mental health provider. Mental health provider ratios range from 797.3 people per provider in Alabama to 141.8 people per provider in Massachusetts. Figure 17 below shows the variation in this metric across the nation.

FIGURE 17 - RATIO OF POPULATION TO MENTAL HEALTH PROVIDERS BY STATE, 2022

#### **Therapy Access Ratio**

In this report, we introduce the Therapy Access Ratio (TAR), a novel metric designed to illustrate the relationship between provider supply and the use of therapy services across the United States, factoring in regional differences in the prevalence of behavioral health conditions.

The TAR measures how the number of outpatient behavioral health therapy visits that a person with a behavioral health diagnosis uses varies between those living in areas with different levels of behavioral health provider supply. We use the average number of therapy visits per person with a behavioral health diagnosis in Metropolitan Statistical Areas (MSAs) with the highest supply (top decile) of behavioral health providers as a reference point. This rate serves as the reference point for comparison for each other MSA. For each MSA, the TAR is expressed as a percentage, comparing the observed number of therapy visits per person to the reference rate. At the state level, the TAR represents a population-prevalence weighted average of the MSAs within the state. A TAR of 100% indicates that individuals in the region with behavioral health diagnoses receive as many therapy visits per person as those in areas with the highest behavioral health provider supply density, while a TAR of 50% signifies that individuals receive half as many visits.

There is significant variation in this ratio across the United States. Those with behavioral health conditions living in Massachusetts and Florida received 97.9% and 22.9%, respectively, of the therapy visits compared to those in areas with the highest provider density. Figure 18 below summarizes the Therapy Access Ratio across healthcare coverage types. Figure 19 illustrates the national variation in the ratio across three major insurance coverage types combined.

FIGURE 19 – VARIATION AMONG STATES IN THERAPY ACCESS RATIO, MAJOR HEALTHCARE COVERAGE TYPES COMBINED, 2021

#### Percent of costs for behavioral healthcare that are for services provided out of network

Out-of-network services often come with higher patient cost sharing requirements and may necessitate additional steps for coverage approval. The percentage of care provided out of network may serve as an indicator of the adequacy of commercial insurance networks in providing patients with access to in-network care.

For this study, we analyzed the percentage of costs for behavioral health services that were provided out of network in commercial health plans that offer out-of-network coverage. We divided these services into three broad categories: inpatient and residential care, intensive outpatient and partial hospitalization programs, and outpatient therapy and other services. Note that Medicare, Medicaid, and commercial health plan types that do not typically cover out-of-network care were not included in this measure.

Overall, we found that 16.4% of costs for behavioral health services in these plans was for out-of-network providers. More specifically, 18.4% of costs for inpatient and residential care, 28.3% of costs for intensive outpatient and partial hospitalization programs, and 13.2% of outpatient therapy and other services costs were for out-of-network providers. New Jersey has the highest out of network rate, where 49.9% of all costs for behavioral healthcare were for out-of-network care, and Hawaii and South Dakota had the lowest rates at 1.9% and 2.0%, respectively. Figure 20 displays the percentage of costs for behavioral health services that were for out-of-network care by state and by category of service.

Note that while Milliman has reported extensively on disparities in out-of-network care in past reports, these metrics are not directly comparable to prior publications because this analysis examines out-of-network usage in terms of costs, rather than in terms of visits or units of service. Because out-of-network providers may charge patients different rates than in-network providers, this will not always correlate out-of-network use rates calculated based on visits or units of service, but accurately reflects the impact of out-of-network use on the cost of behavioral healthcare.

FIGURE 20 – PERCENT OF COSTS FOR BEHAVIORAL HEALTH SERVICES PROVIDED OUT-OF-NETWORK IN COMMERCIAL HEALTH INSURANCE PLANS THAT COVER OUT-OF-NETWORK SERVICES, 2021

#### Provider insurance acceptance rates

Low provider insurance acceptance rates can create financial barriers to care, even when individuals are insured. Nationally, psychiatrists tend to be less likely to accept all major insurance coverage types than other specialties. A recent study conducted by the Kaiser Family Foundation found that in 2019 across all non-pediatric office-based physicians, 89% accepted new Medicare patients and 91% accepted new privately insured patients, but only 60% of psychiatrists accepted new Medicare patients and 59% accepted new privately-insured patients.<sup>27</sup> In a separate report using 2017 survey data, the Medicaid and CHIP Payment and Access Commission (MACPAC) found that 45.5% of psychiatrists accepted new patients with Medicaid as compared to 74.3% across all specialty types.<sup>28</sup>

While insurance acceptance rates may vary from state to state, to our knowledge, state-level information on behavioral health provider insurance acceptance rates has not been reported in the literature.

#### Patient out-of-pocket and self-pay costs for behavioral health services

We measured affordability of care using patient out-of-pocket costs, patient self-pay costs when uninsured and the uninsured rate. We selected a frequently used service, 60 min Psychotherapy Visit, to demonstrate variation in self-pay and out-of-pocket costs for patients. Nationally, the average self-pay cost for someone without insurance coverage

was \$174 per visit. On the low end, South Carolina average self-pay costs are \$94 per visit and on the high end, Louisiana average self-pay costs are \$287 per visit. Among the commercially insured, the average out-of-pocket cost for an in-network visit was \$23 (range: \$1 - \$46) and out-of-network was \$53 per visit (range: \$24 - \$98). Among those with Medicare, the average cost per visit was \$29 for Medicare FFS and \$14 for Medicare Advantage. Out-of-pocket costs under Medicaid for covered services are generally nominal and are not reported.

FIGURE 21 – AVERAGE OUT-OF-POCKET COSTS FOR A 60 MINUTE PSYCHOTHERAPY VISIT, BY HEALTHCARE COVERAGE TYPE, 2021

	No Coverage	Comn	nercial	Medicare FFS	Medicare Advantag	
	Self-pay	In-network providers	Out-of-network providers	Covered providers	Covered providers	
Lowest cost state/division*	\$93.92	\$0.98	\$24.08	\$25.61	\$5.92	
National average cost	\$174.46	\$22.71	\$52.87	\$29.12	\$13.83	
Highest cost state/division*	\$286.89	\$45.50	\$97.84	\$37.33	\$29.92	

<sup>\*</sup>Commercial and Medicare FFS ranges are at the state level; Medicare Advantage ranges are at the Census division level

#### FIGURE 22 - AVERAGE SELF-PAY COSTS FOR A 60 MINUTE PSYCHOTHERAPY VISIT, 2021

Many other services for behavioral health can be substantially more expensive than a standard psychotherapy visit, however we have focused on costs for this service as therapy visits often serve as an entry point for other types of care, and thus can represent the first financial barrier that many individuals may face when seeking care.

#### Uninsured rate and median household income

Healthcare coverage can help reduce financial barriers to care, but 8.6% of the U.S. population was uninsured in 2021. At the state level, the uninsured rate ranges from 2.5% in Massachusetts to 18% in Texas. The out-of-pocket costs that individuals face (including either self-pay costs for those without insurance or patient cost sharing amounts for those with insurance) can serve as a barrier to care. As of 2021, 12.6% of the U.S. population lives below the Federal Poverty Level (a measure of household income referenced in many state and federal assistance programs that varies based on family size).<sup>29</sup> By state, the proportion of the population with incomes below the FPL ranges from 7.4% in New Hampshire to 19.4% in Mississippi. Uninsured rates tend to be inversely correlated with median household income by state. Figure 23 displays the relationship between the uninsured rate and median household income across the nation and highlights states that fall in the top 3 or bottom 3 of each metric.

FIGURE 23 – SCATTER PLOT OF UNINSURED RATE VERSUS MEDIAN HOUSEHOLD INCOME, BY STATE, 2021

### Discussion

This report highlights the challenges of access to behavioral health services in the United States., a problem highlighted by but not created by the COVID-19 pandemic. The prevalence of behavioral health conditions has increased significantly in recent decades yet many Americans living with these conditions do not receive needed services and live in areas where behavioral health clinicians are in short supply.<sup>30</sup>

Not only is the United States. experiencing an overall shortage of providers, but there is an even greater shortage of culturally or linguistically representative care available. One study found that only 10% of practicing psychiatrists identified as Black or Hispanic, but almost one-third of the U.S. population identifies this way.<sup>31</sup> This shortage limits the ability for people to receive care from providers with which they share important aspects of their identity, which some studies have shown can improve health outcomes and patients' perceptions of their care experience.<sup>32</sup>

This report also underscores the significant geographic variation in access to behavioral health services across the country. The variation in measurement suggests policy solutions should be location and population specific rather than using a one-size-fits-all approach. Place-based context is critical when using these results to design effective solutions. Factors such as differences in behavioral health needs, the supply of behavioral health clinicians, provider networks, socioeconomic conditions, cultural attitudes, and local, state, and federal-level policies all influence the extent to which individuals can access these services. The study provides an overview of behavioral healthcare access measures across all 50 states, including details by healthcare coverage type, to inform the development of policy solutions or targeted interventions. Such policies or interventions should consider the multi-faceted causes of these issues to create effective solutions.

## Methodology

#### **DATA SOURCES**

Measures for this report were constructed using a variety of data sources. We relied on three large, national research databases with administrative claims and enrollment data to derive diagnosis, cost, and utilization-based measures:

- 2021 Milliman Consolidated Health Cost Guidelines<sup>TM</sup> Database
  - The Milliman Consolidated Health Cost Guidelines Databases contain healthcare experience primarily for large group commercial members, using data contributed from a number of payers with which Milliman has data purchase or trade agreements. Milliman collects this data from various health plans for use in product development, research, and client projects.
- 2021 CMS 100% Research Identifiable Files (RIF) for Medicare
  - CMS 100% Medicare RIF contains detailed administrative claims data for all patients covered by Medicare FFS, including medical claims paid under Medicare Parts A and B and prescription drug claims paid under Part D.
- 2021 Transformed Medicaid and CHIP Statistical Information System (T-MSIS) data for Medicaid and CHIP
  - T-MSIS contains detailed administrative claims for all patients covered by Medicaid and CHIP.

In cases where metrics are reported as a blend across three major healthcare coverage types, we have weighted each type by total covered population estimates from U.S. Census and other data to normalize for differences between our study sample and the general population.

In addition to detailed administrative claim level datasets, we also utilized public data sources and publications for specific population, demographic, and self-reported health measures. For several of these measures, we relied on public data as compiled by County Health Rankings and Roadmaps, a program of the Robert Wood Johnson Foundation in collaboration with the University of Wisconsin Public Health Institute.<sup>33</sup> County Health Rankings and Roadmaps compiles data across publicly available health data sources including Behavioral Risk Factor Surveillance System (BRFSS), American Community Survey (ACS), and Small Area Health Insurance Estimates (SAHIE) related to health outcomes and risk factors. County Health Rankings data is available as statistically weighted, standardized data ranked by state or raw, unranked data. We used the raw, unranked data for our analysis. The following measures were sourced from the County Health Rankings 2023 report.

- Percent of Adults with frequent mental distress
- Rate of poor mental health days
- Rate of drug overdose deaths
- Rate of suicide deaths
- Mental health providers
- Median household income
- Uninsured rate
- State and county population estimates

Detailed specifications on measures compiled by County Health rankings can be found at countyhealthrankings.org.

We also relied on detailed population statistics from the U.S. Census Bureau American Community Survey (ACS).<sup>34</sup> The American Community Survey is an annual survey conducted on a sample of the U.S. population that describes social, economic, and demographic characteristics. Geographic estimates are produced using statistical techniques and datasets are available for 1- and 5- year estimates. The following measures were sourced from the 2021 American Community Survey 5-year estimates.

- Private insurance: number of people covered.
- Medicare: number of people covered.
- Medicaid: number of people covered.

ACS defines healthcare coverage as follows:

- "Medicaid: Includes those covered by Medicaid, Medical Assistance, Children's Health Insurance Plan (CHIP) or any kind of government-assistance plan for those with low incomes or a disability, as well as those who have both Medicaid and another type of coverage, such as dual eligibles who are also covered by Medicare.
- Medicare: Includes those covered by Medicare, Medicare Advantage, and those who have Medicare and another type of non-Medicaid coverage where Medicare appears to be the primary payer. Excludes seniors who also report employer-sponsored coverage and full-time work, and those covered by Medicare and Medicaid (dual eligibles)."

We also relied on Mental Health Professional Shortage Areas (HPSA) as defined by the Health Resources and Services Administration for parts of this analysis.<sup>35</sup>

#### **SAMPLE SELECTION**

For all measures derived from administrative healthcare claims data, we restricted our sample to individuals with 12 months of medical coverage in the 2021 calendar year. Information on the sample size used for this analysis by state and healthcare coverage type can be found in Appendix C.

#### **IDENTIFICATION OF INDIVIDUALS WITH BEHAVIORAL HEALTH CONDITIONS:**

Patients were considered to have a behavioral health condition if they met one of the following criteria:

- <u>Behavioral health conditions.</u> Codes in the F-series of the International Classification of Diseases, 10<sup>th</sup> Revision, Clinical Modification (ICD-10-CM) were considered behavioral, except for codes indicating a history of a condition, conditions in remission, substance use without complications, factors or symptoms associated with other disorders or diseases, individual symptoms that may not alone satisfy diagnostic criteria, etc. Patients were required to have at least one relevant ICD-10-CM code in any position on any claim.
- <u>Attempted suicide or intentional self-harm.</u> Individuals were included if they experienced an injury, poisoning by drugs, medications or biological substances, the toxic effects of chiefly nonmedicinal substances, or asphyxiation where the intent was coded as "intentional self-harm". Individuals were also included if they experienced suicidal ideation. For this measure we used ICD-10-CM codes according to the case definition developed by Hedegaard, et. al for an NCHS brief.<sup>36</sup> Patients were required to have at least one relevant ICD-10-CM code in any position on any claim.

#### **IDENTIFICATION OF BEHAVIORAL HEALTH COSTS AND TREATMENT**

We defined behavioral health specialty treatment to include the following:

- Inpatient hospitalizations with diagnosis-related-groups (DRG) related to behavioral health.
- Admissions to residential treatment facilities for mental health or substance use disorders.
- Intensive outpatient and partial hospitalization programs.
- Electroconvulsive therapy, transcranial magnetic stimulation, biofeedback, and other related therapies.
- Evaluation and management visits provided by psychiatrists or other psychiatrist-supervised clinicians.
- Outpatient counseling and psychotherapy services.
- Applied behavioral analysis for autism spectrum disorders.
- Behavioral health diagnostic and evaluation services, other than those provided as part of routine preventive screenings.
- Other miscellaneous outpatient services specific to behavioral health.

Primary care providers can sometimes be the first point of contact for some individuals with behavioral health conditions, can prescribe medications for behavioral health conditions, and can provide referrals to behavioral health specialists. Similarly, emergency departments are often used for behavioral healthcare when individuals are in crisis or if other appropriate outpatient care is not available promptly. However, we have not included these provider types in this metric as the intent is to reflect access to professionals and facilities that specialize in behavioral health.

Follow-up care after an inpatient hospitalization or emergency department visit with a diagnosis in the first or second position for a behavioral health condition was defined to include intensive outpatient care, partial hospitalization, or professional outpatient psychiatric visits within 30 days from the date of discharge. Note that related but not identical measures are included in some quality performance measurement initiatives. Our definition is not intended to replicate any particular definition or criteria used in any specific program.

Out-of-pocket costs were defined as the proportion of costs for services described above that were the responsibility of the patient. This does not include any balance billing that may have occurred by providers that sought payment from patients for differences between amounts billed by the provider and allowed by the healthcare payor. Self-pay cost was defined as the amount billed (prior to any negotiated discounts) by providers that also accepted commercial insurance coverage.

The Therapy Access Ratio is calculated as the difference between the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA relative to the average number of therapy visits received by individuals with behavioral health conditions living in the top decile of MSAs with the highest behavioral health provider supply density. The metric is expressed as a percentage.

We identified 60-minute psychotherapy visits using CPT code 90837.

#### Caveats and limitations

This report describes measures related to the prevalence of behavioral health conditions, how individuals use behavioral healthcare, and barriers to access and affordability of behavioral healthcare. This study does not and is not intended to establish specific causal links between any of the measures studied. The causes and consequences of behavioral health conditions and challenges in the behavioral healthcare delivery system are myriad and beyond the scope of any individual study.

This study relies on commercial, Medicare FFS, and Medicaid administrative claims data to identify behavioral health conditions. As such, results may not be generalizable to individuals with other types of coverage such as TRICARE or Indian Health Services, or uninsured individuals.

To the extent that behavioral health conditions go unreported in the claims data, our measures based on administrative data might be understated. As the reach of digital behavioral health providers that do not always directly interact with health insurance carriers increases, healthcare claims data may increasingly understate the totality of behavioral health services and diagnoses.

For measures based on administrative claim data, our study only includes individuals with a full year of insurance eligibility, which includes a substantial majority of individuals with healthcare coverage available for study but excludes some individuals who were unable to maintain a full year of employment or who were not eligible for Medicare or Medicaid for the entire year. Due to rules against Medicaid disenrollment that were in place during the COVID-19 Public Health Emergency, the proportion of Medicaid beneficiaries enrolled for less than a full year was likely lower than typical during the timeframe included in this study.

We did not adjust for sex or gender differences across healthcare coverage types or states. Medicaid eligibility criteria also varies across states, meaning differences in Medicaid measures may also reflect different population characteristics.

We also relied on publicly available data sources that include national survey data. Of note, survey data often has limitations due to its reliance on self-reported information, which can lead to inaccuracies due to respondent bias or misunderstanding of questions. Additionally, it may not be fully representative of a population as the methodology can often exclude certain groups such as those without internet or phone access, leading to potential sampling bias. Relatedly Medicaid coverage estimates from the ACS are likely an undercount and research has demonstrated undercounts of Medicaid associated with ACA Medicaid expansions. Some of the publicly available measures rely on different data sources published in different years or include data averaged across multiple years. In all cases, the most recent data available at the time of publication was used. Many publicly available sources report small area estimates that are derived from statistical modeling. Smaller population areas, with a lower number of survey responses

will rely more on modeled data than actual rates. Further documentation related to data collection and measures calculations can be found on the websites for individual data sources.

We recognize that there are elements of behavioral health access that could not be captured in this analysis, as the analysis was limited to administrative claims and publicly available data sources.

We have not audited the data sets used for this analysis, but have extensive experience using them, and have found them to be reasonable for these purposes. Any errors or omissions in the data sets could affect the results in this report. Some of the data contributors may use third-party vendors to provide behavioral health services, which could lead to the exclusion of some behavioral healthcare claims from these data sets. We are not able to directly identify coverage levels or use of third-party vendors for behavioral healthcare in the data sets used for this analysis. However, we have carefully inspected the data to identify contributors with claims patterns that may indicate incomplete reporting of behavioral health data and have found that incomplete reporting likely impacts a small minority of contributors. Medicare FFS and Medicaid data are representative of 100% of the plan beneficiaries. However, Medicaid data quality varies by state, and the commercial and Medicare Advantage data represents geographic and demographic mix available in the research databases used for analysis.

### Acknowledgements

This report was commissioned by Inseparable, Inc., a mental health advocacy organization.<sup>39</sup> The report was completed under the terms of the consulting services agreement between Milliman and Inseparable. All opinions or views expressed in this report are those of the authors, not Milliman. Milliman does not intend to benefit or create a legal duty to any recipients of this report. As a matter of policy, Milliman does not endorse any product, service, or initiative, and no such endorsement is intended for Inseparable.

The authors would like to thank Jacob Anderson, Anna Phillips, Trevor McCord, and Zane Weigand for their helpful contributions to the analyses included in this report, as well as Barbara Dewey for her pre-publication peer review of this report.

## Glossary

This glossary describes key terms, as they are used in this report.

- Behavioral health: An umbrella term used to describe both mental health and substance use disorders.
- Behavioral health specialist: A healthcare facility or professional that specializes in services for the purpose of treating an individual's mental health or substance use disorders. See the Methodology section for the technical specifications used in this analysis.
- **Commercial insurance**: A type of health insurance that is generally purchased or sponsored by employers or purchased on the individual market.
- Diagnosed prevalence: The number of cases of a disease that have been diagnosed by a healthcare professional.
- Emergency department utilization: The use of emergency departments for healthcare services.
- **Federal poverty level (FPL)**: A measure of income issued every year by the Department of Health and Human Services (HHS). Federal poverty levels are used to determine eligibility for certain programs and benefits.
- **Frequent mental distress**: The percentage of adults who report that their mental health was not good for 14 or more of the past 30 days.
- **In-network**: Physicians, hospitals, or other healthcare providers who have a contract with the health insurance plan to provide services to plan members for specific pre-negotiated rates.
- **Inpatient hospitalization**: When a patient is admitted to the hospital for treatment with the expectation that they will remain in the hospital for 24 hours or more.
- Intensive outpatient and partial hospitalization programs: Structured programs that provide care for several hours a day, several days a week, but do not require an overnight stay.
- Intentional self-harm: Behaviors where an individual intentionally inflicts harm on themselves.
- **Median household income**: The income amount that divides a population into two equal groups, half having an income above that amount, and half having an income below that amount.
- Medicaid: A state and federal program that provides health coverage for some low-income people, families and children, pregnant women, the elderly, and people with disabilities.
- **Medicare**: A federal program that provides health coverage for those aged 65 or older or that have certain qualifying disabilities.
- Mental Health Care Health Professional Shortage Areas (HPSA): Geographic areas, population groups, or facilities designated by the Health Resources and Services Administration (HRSA) as having shortages of primary care, dental care, or mental health providers.
- Mental health: In some contexts, this term refers to a range of clinical conditions including depression, anxiety disorders, schizophrenia, and others. In other contexts, the term is also used to refer to a person's general emotional, psychological, and social well-being.
- Metropolitan Statistical Areas (MSAs): Geographic entities defined by the U.S. Office of Management and Budget for use by federal statistical agencies in collecting, tabulating, and publishing federal statistics.
- **Out-of-network**: Physicians, hospitals, or other healthcare providers who are not part of a health insurer's network of preferred providers. Patients will generally pay more for services received from out-of-network providers.
- Out-of-pocket costs: Medical costs that are not covered by insurance and must be paid by the patient.
- Outpatient therapy: Behavioral healthcare services that do not require an overnight stay in a hospital or medical facility.
- **Prevalence**: A statistical concept referring to the number of cases of a clinical condition that are present in a particular population at a given time.
- Provider networks: Groups of healthcare providers that have contracts with an insurance company to provide services to plan members, generally for specific pre-negotiated rates.

- **Psychiatrist need met**: The percentage of the estimated need for psychiatrists that is being met in a particular area, based on HRSA's criteria for defining Mental Health Professional Shortage Areas.
- **Psychotherapy**: A general term for treating mental health problems by talking with a psychiatrist, psychologist, or other mental health provider.
- Reimbursement structures: Methods used by health insurance companies to pay healthcare providers for their services.
- Self-pay: Patients who pay for their own medical expenses without the help of insurance.
- **Socioeconomic conditions**: The combination of social and economic factors that influence what positions individuals or groups hold within the structure of a society.
- **Substance use disorders**: Health conditions associated with the use of one or more substances, leading to health issues or problems at work, school, or home.
- Suicidal ideation: Thoughts about, or an unusual preoccupation with, suicide.
- Therapy Access Ratio (TAR): A novel metric designed to evaluate the correlation of provider supply and the accessibility of therapy services across the United States, factoring in regional differences in the prevalence of behavioral health conditions.
- **Timely follow-up care**: The care received shortly after a hospital stay or emergency department visit, which is important for successful recovery and preventing readmission to the hospital.
- Uninsured rate: The percentage of the population that does not have healthcare coverage.

## Appendix A: Summary of behavioral health access measures by state

For ease of reference, we have summarized the metrics described throughout this report for each state in the figures that follow. Sources or definitions for each metric are described below. Further technical details are provided in the Methodology section of this report.

Measure Prevalence of behavioral health conditions	Description	Source and year
Adults with frequent mental distress.	Percent of adults reporting at least 14 days of poor mental health per month.	BRFSS, 2020.
Poor mental health days per month.	Average number of mentally unhealthy days out of the past 30.	BRFSS, 2020.
Drug overdose deaths per 100,000.	Number of drug overdose deaths per 100,000 population.	NCHS – Mortality Files, 2018-2020.
Suicides per 100,000.	Number of suicide deaths per 100,000 population.	NCHS – Mortality Files, 2016-2020.
Individuals with any diagnosed MH/SUD condition.	Percent of individuals that had claims with diagnoses for any behavioral health condition.	CHSD, RIF, and T-MSIS claims datasets, 2021.
Percent of individuals with diagnosed suicidal ideation or intentional self-harm.	Percent of individuals that had claims with diagnoses for suicidal ideation or intentional self-harm.	CHSD, RIF, and T-MSIS claims datasets, 2021.
Behavioral health treatment patterns		
Percent of individuals with any MH/SUD diagnosis that received specialty MH/SUD care.	Percent of individuals with diagnoses for any behavioral health condition that used any services provided by facilities or clinicians specializing in behavioral health.	CHSD, RIF, and T-MSIS claims datasets, 2021.
Average number of sessions per year for those receiving outpatient BH therapy.	Average number of outpatient psychotherapy visits received per year among individuals that received any outpatient psychotherapy.	CHSD, RIF, and T-MSIS claims datasets, 2021.
Percent of emergency department visits with a diagnosis for any MH/SUD condition in the first or second position.	Percent of emergency department visits that had a diagnosis for any behavioral health condition in the first or second position on the claim record.	CHSD, RIF, and T-MSIS claims datasets, 2021.
Percent of MH/SUD emergency department visits or hospitalizations with timely follow-up after discharge.	Percent of hospitalizations or emergency department visits with a principal diagnosis for any behavioral health condition that were followed by outpatient behavioral health care within 30 days of discharge.	CHSD, RIF, and T-MSIS claims datasets, 2021.
Availability of behavioral health providers		
Percent of population living in a county where whole county is shortage area or none of county is shortage area.	Sum of population in counties that are entirely within designated mental health HPSAs, or that include no designated mental health HPSAs.	ACS, HPSA, 2023.
Percent of psychiatrist need met.	Percent of psychiatrists needed to remove all mental health HPSA designations, per HRSA HPSA definitions.	HPSA, 2023.
Percent of MH/SUD care provided out-of- network (for commercial health plans with OON coverage).	The percent of total costs for behavioral healthcare services that were for out-of-network providers (for commercial health insurance plans that cover out-of-network providers).	CHSD, RIF, and T-MSIS claims datasets, 2021.
Therapy Access Ratio.	A novel metric describing the proportion of visits received by those with behavioral health diagnoses compared to the number of visits received by those living in areas with the highest provider supply.	CMS NPI Registry, CHSD, RIF, and T-MSIS claims datasets, 2021.
Affordability of behavioral health services		
Average out of pocket costs for an individual 60-minute psychotherapy visit.	Average cost for which patients are responsible under the terms of their insurance coverage (or average undiscounted billed charge for self-pay patients) for a 60-minute psychotherapy visit.	CHSD and RIF claims datasets, 2021.
Percent of providers accepting insurance coverage.	Percent of psychiatrists that accept each major type of healthcare coverage.	MACPAC, 2017 and KFF, 2017-2019.
Percent of population by healthcare coverage type.	The percent of the total population covered by each major healthcare type.	ACS, 2021, 5Y average.
Median income.	The income level that divides the population in half, where half have higher, and half have lower incomes.	U.S. Census SAIPE, 2021.
Percent of individuals below FPL.	Ther percent of individuals in households with income levels below the Federal Poverty Level.	ACS, 2021, 5Y average.

#### Notes:

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.

December 2023

- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.

- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.

  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.

  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

Gradient Interpretation			Adverse		Favorab
			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.

  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

FIGURE A-23: BEHAVIORAL HEALTH ACCESS MEASURES FOR MICHIGAN

revalence of behavioral health conditions	Michigan	Rank	Min	Michigan	Max

Gradient Interpretation			Adverse		Favorabl
			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

FIGURE A-25: BEHAVIORAL HEALTH ACCESS MEASURES FOR MISSISSIPPI

revalence of behavioral health conditions	Mississippi	Rank	Min	Mississippi	Max
Survey and vital statistics measures					
Adults with frequent mental distress	14.6%	34	9.7%		18.7%
Poor mental health days per month	4.4	24	3.2		5.7
Drug overdose deaths per 100,000	14.4	9	8.5		56.8
Suicides per 100,000	13.9	16	6.2		27.4
Individuals with any diagnosed MH/SUD condition			•	<u>.</u>

			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

Gradient Interpretation			Adverse		Favorabl
			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

Gradient Interpretation			Adverse		Favorab
			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

FIGURE A-34: BEHAVIORAL HEALTH ACCESS MEASURES FOR NORTH CAROLINA

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.

  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

FIGURE A-35: BEHAVIORAL HEALTH ACCESS MEASURES FOR NORTH DAKOTA

revalence of behavioral health conditions	North Dakota	Rank	Min	North Dakota	Max
Survey and vital statistics measures			_	_	
Adults with frequent mental distress	11.5%	5	9.7%		18.7%
Poor mental health days per month	3.6	5	3.2		5.7
Drug overdose deaths per 100,000	11.6	4	8.5		56.8
Suicides per 100,000	19.0	40	6.2		27.4
Individuals with any diagnosed MH/SUD condition				-	,

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

Gradient Interpretation			Adverse		Favorab
			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.

  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.

  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

Gradient Interpretation			Adverse		Favorab
			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

Gradient Interpretation			Adverse		Favorab
			Favorable		Adverse

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

FIGURE A-51: BEHAVIORAL HEALTH ACCESS MEASURES FOR WYOMING

revalence of behavioral health conditions	Wyoming	Rank	Min	Wyoming	Max

- 1. Kansas uses 2020 prevalence metrics for commercial insurance due to data quality issues with the 2021 data.
- 2. Medicare Advantage metrics can be found by Census division in Appendix B.
- 3. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 4. Aggregate metrics are calculated using the percent of population by insurance type.
- 5. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 6. "Percent of Need Met" is computed by dividing the number of psychiatrists available to serve the population of the area, group, or facility by the number of psychiatrists that would be necessary to eliminate the mental health HPSA (based on a ratio of 30,000 to 1 (20,000 to 1 where high needs are indicated)).
- 7. Measured by volume of allowed dollars.
  8. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio illustrates how close an MSA, and by extension a state, is to achieving the reference rate.
- 9. Defined by HCPCS 90837.
- 10. Dual-eligible members are reported in the Medicaid category. The Medicare category reflect Medicare-only members.
- 11. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.

# Appendix B: Summary of behavioral health access measures by Census division for Medicare Advantage

For ease of reference, we have summarized the Medicare Advantage results for metrics described throughout this report for each Census division in the figures that follow. Sources or definitions for each metric are described below. Further technical details are provided in the Methodology section of this report.

Measure	Description	Source and year
Prevalence of behavioral health conditions	•	
Individuals with any diagnosed MH/SUD condition.	Percent of individuals that had claims with diagnoses for any behavioral health condition.	CHSD claims dataset, 2021.
Percent of individuals with diagnosed suicidal ideation or intentional self-harm.	Percent of individuals that had claims with diagnoses for suicidal ideation or intentional self-harm.	CHSD claims dataset, 2021.
Behavioral health treatment patterns		
Percent of individuals with any MH/SUD diagnosis that received specialty MH/SUD care.	Percent of individuals with diagnoses for any behavioral health condition that used any services provided by facilities or clinicians specializing in behavioral health.	CHSD claims dataset, 2021.
Average number of sessions per year for those receiving outpatient BH therapy.	Average number of outpatient psychotherapy visits received per year among individuals that received any outpatient psychotherapy.	CHSD claims dataset, 2021.
Percent of emergency department visits with a diagnosis for any MH/SUD condition in the first or second position.	Percent of emergency department visits that had a diagnosis for any behavioral health condition in the first or second position on the claim record.	CHSD claims dataset, 2021.
Percent of MH/SUD emergency department visits or hospitalizations with timely follow-up after discharge.	Percent of hospitalizations or emergency department visits with a principal diagnosis for any behavioral health condition that were followed by outpatient behavioral health care within 30 days of discharge.	CHSD, RIF, and T-MSIS claims datasets, 2021.
Availability of behavioral health providers		
Therapy Access Ratio.	A novel metric describing the proportion of visits received by those with behavioral health diagnoses compared to the number of visits received by those living in areas with the highest provider supply.	CMS NPI Registry, CHSD claims dataset, 2021.
Affordability of behavioral health services		
Average out of pocket costs for an individual 60-minute psychotherapy visit.	Average cost for which patients are responsible under the terms of their insurance coverage (or average undiscounted billed charge for self-pay patients) for a 60-minute psychotherapy visit.	CHSD claims dataset, 2021.

Adverse Favorable Adverse

- 1. Specialty care is defined as care from a behavioral health specialist in an inpatient, outpatient, or professional setting.
- 2. Timely follow-up is defined as a follow-up visit within 30 days of discharge.
- 3. Calculated as the average number of therapy visits received by individuals diagnosed with behavioral health conditions in a given MSA, compared against the top decile of MSAs with the highest behavioral health provider supply density. Expressed as a percentage, this ratio reveals how close an MSA, and by extension a state, is to achieving the reference rate.
- 4. Defined by HCPCS 90837.
- 5. Data for the District of Columbia is not available for all metrics. D.C. is included in rankings only for metrics for which data are available.
- 6. The Medicare Advantage data has been segmented into 9 total divisions.
- 7. Metrics are displayed and ranked at the division level; they have not been normalized by geographic distribution.
